What is AI?

Artificial Intelligence is a branch of computer science that simulates tasks previously requiring human intelligence, such as speech recognition and pattern identification. Currently, AI cannot truly learn or reason; it makes decisions based on analyzing numerous data points. AI is advancing into Machine Learning, which allows systems to learn from data, and even further into Deep Learning, which uses complex neural networks to improve and adapt autonomously.

Machine Learning:

Machine Learning involves creating algorithms that learn from data and make predictions.

If I showed a machine 1000+ images of cats, it would learn to identify cats. Then, when asked to identify this picture, it would correctly recognize it as a cat.

Deep Learning:

Deep Learning is a subset of Machine Learning that uses artificial neural networks with multiple layers to process and analyze data to reach a conclusion.

If I showed you this image what would you say it was?

Deep learning may require hundreds of thousands of data points to “learn” that this image represents cat eyes.

What is AI Capable Of?

- **Data Analysis:** Process and analyze vast amounts of data quickly and accurately, uncovering patterns and insights that would be difficult for humans to detect.
- **Automation:** Automate repetitive tasks, freeing up human workers for more complex and creative activities.
- **Natural Language Processing (NLP):** Understand, interpret, and generate human language, enabling applications like chatbots, virtual assistants, and language translation.
- **Machine Learning:** AI systems can learn from data and improve their performance over time without being explicitly programmed for specific tasks.
- **Computer Vision:** Analyze and interpret visual information from the world, enabling applications like facial recognition, object detection, and medical imaging analysis.
- **Decision Making:** Support or automate decision-making processes in various fields by providing data-driven recommendations or autonomously executing decisions.

Where is AI being used?

Education

- Personalized Learning: AI tailors educational content and pacing to individual student needs.
- Automated Grading: AI systems grade assignments and tests, providing quick feedback.
- Tutoring Systems: AI-powered tutors offer help and explanations outside of classroom hours.

Marketing

- Customer Segmentation: AI analyzes data to segment customers based on behaviors and preferences.
- Personalized Campaigns: AI creates personalized marketing messages and product recommendations.
- Chatbots: AI-driven chatbots provide instant customer service and engagement.

Social Media

- Content Moderation: AI detects and removes inappropriate or harmful content.
- Recommendation Systems: AI suggests content to users based on their interests and behavior.
- Sentiment Analysis: AI analyzes user sentiment to gauge public opinion and engagement.

Scams

- Phishing Detection: AI identifies phishing emails and fraudulent websites.
- Fraud Detection: AI analyzes patterns to detect fraudulent transactions and activities.
- Impersonation: Scammers use AI to mimic voices or create deepfake videos for fraud.

Implications of AI in Academia

Positives

- **Personalized Learning**
 - Individualized learning
- **Enhanced Student Engagement**
 - Tutoring, feedback, additional resources
- **Efficiency in Administrative Tasks**
 - Automated grading, scheduling, admissions processes
 - Allows for more time one on one with students
- **Data-Driven Insights**
 - Analyzes large amounts of data about student performance for interventions
- **Access to Resources**
 - More equitable access to resources, research materials and educational software

Implications of AI in Academia

Negatives

- **Equity and Access**
 - Paid vs Unpaid access to AI
- **Privacy Concerns**
 - Unpaid or Free Data is learned from.
 - Paid version (Work) Data is private and not learned from.
- **Bias and Fairness**
 - Biased data, leads to biased results

Implications of AI in Academia

Negatives

- **Dehumanization of Education**
 - Over reliance
- **Academic Integrity**
 - Using GPTs work as your own.
- **Job Displacement**
 - Jobs will not be replaced by AI, but the employee that knows how to use AI will replace you.

Ideas for New Guidelines

Expanding Academic Integrity Policies to Include AI

Address and define academic dishonesty in the context of AI tools.

Move from class-based AI policies to college-wide AI policies.

Create a committee for semester policy updates.

Creating Workshops

Develop and conduct workshops to educate students and faculty about the ethical use of AI.

Incorporate AI education into new personnel orientation and onboarding.

Focus on privacy, data, and security.

****Microsoft new CoPilot Recall Feature****

Ideas for New Guidelines

Implementing College-Based AI Licenses

Consider college-based licenses for AI usage.

Potentially include AI fees in tuition.

Explore creating a custom AI tool (e.g., NMSU GPT wrapper).

AI Professional Development

Provide ongoing professional development in AI for faculty, staff, and students.

Final Thoughts

AI is here to stay.

Staying current and ahead of the game in AI requires continuous learning and adaptation.

Embrace an open mind and be ready to change your ideas and ways of thinking.

This version maintains the key points while making the message clearer and more concise.
